In the 21st century, CAD software is used for a variety of purposes and has a variety of users. Some CAD users specialize in geometric design, whereas other CAD users specialize in architectural or engineering design. For this article, CAD is defined as a form of computer-aided design that uses (or can use) computers to aid with the design and creation of two- and three-dimensional drawings. Other definitions include "a group of computer aided design tools used to create models, drawings, and images of industrial or mechanical products, infrastructure and plants." In the 21st century, the dominant products in the CAD market are desktop- and web-based CAD software. Desktop CAD software works on the desktop with a single display. Users interact with the software application using a keyboard and mouse. Web-based CAD software works on a web browser with a display similar to the one used for browsing the Internet. Users interact with the software application using a browser and a mouse. [Background](#) [edit] The first commercially successful personal computer CAD programs were developed in the 1970s. In the late 1970s, the first CAD software for personal computers was developed for the COSMAC Sirius, a portable microcomputer. The Sirius was released in 1979, and the Sirius CAD program was released the following year. A few of the early microcomputer-based CAD applications were commercially successful. However, by the end of the 1970s, both the COSMAC Sirius CAD program and the Michigan Micromouse CAD program were discontinued. In the late 1970s, the first commercially successful CAD applications for mainframe computers were developed. These applications were later adapted to run on minicomputers. In the early 1980s, the first commercially successful CAD applications for microcomputers were developed. [Historical overview](#) [edit] [Early 1980s](#) [edit] In 1982, Autodesk introduced AutoCAD, the first commercially successful CAD application for personal computers. AutoCAD used a user interface (UI) similar to the one used in one of the earliest computer games, Pong. A UI was described by a human-computer interaction (HCI) researcher in 1988 as "a graphical display, accessed through a keyboard, which provides an interactive visual environment for the user." The first graphical user interface (GUI) to be used by CAD software was a point-and-click GUI, also called a mouse-driven interface

Every one has their own way of doing things. What is your preferred platform? ===== woutr_be I find it hard to come up with something better than that. If you're looking for something to track large amounts of small issues (code changes, issues from emails, whatever) then I'd suggest Jira. For my personal needs, as a solo developer I just need to track the issues I work on, that's it. So I went with Trello. But since the issues are more personal, I have Trello linked to a private GitHub issue tracker, so that I can easily see when someone works on my projects. If you want to track something more like a project, I'd recommend Asana. ~~~ rajeshr Thanks for the response. I was also thinking Jira would be great for tracking issues within a team. I do have some issues that I track in Trello. Q: RegEx to get specific numbers out of the text I have a long long text, and i would like to get out only the numbers from this text.
