possible research paths to
address these issues.
There is no question that
many areas of

environmental health have been substantially improved in the past few years, most notably due to better epidemiological study design and analytical techniques. In addition, our understanding of the molecular biology of the cancer process has advanced remarkably, and this has led to a better appreciation of the

complexities of the interactions between environmental agents, and genetic and epigenetic mechanisms that drive carcinogenesis. However, there are still many questions e79caf774b

1. Field of the Invention The present invention relates to a control circuit of a motor. 2. Description of the Related Art A conventional control circuit of a motor in the related art will be described with reference to FIGS. 1 and 2. FIG. 1 is a circuit diagram showing the configuration of the conventional control circuit of a motor, and FIG. 2 is a timing chart showing the operation of the control circuit in FIG. 1. In the conventional control circuit, a switching control unit 30 is supplied with a driving command, a rotational speed (referred to as "speed" hereafter) and a phase angle as a set value, and controls an electric power supplied to a motor 1. In this case, the electric power is supplied to the motor 1 in a switching mode having a conduction period and a non-conduction period determined based on the driving command and the phase angle. Further, the control unit 30 controls switching elements 40 and 50 for switching the electric power supplied to the motor 1 between a positive phase and a negative phase by the switching mode. The control unit 30 thus controls the motor 1. With reference to FIG. 2, the

control unit 30 controls the switching elements 40 and 50 by using a PWM signal as a driving command, and determines a time point when the PWM signal becomes a high level (“Hi” level). When the PWM signal is in the “Hi” level, the conduction period is set for the switching mode. On the other hand, when the PWM signal is in the low level (“Lo” level), the non-conduction period is set for the switching mode. The period for the conduction period and the non-conduction period is determined by the speed and the phase angle (not shown) supplied from an external source. In the example of FIG. 2, the conduction period is set for a period from the rising time to the falling time of the PWM signal. In other words, the electric power supplied to the motor 1 is made active in the conduction period. The conduction period is also set for a period from the falling
