The basic photo editing options The Elements version of Photoshop is less advanced than the normal version, but it has a few great features that you will use on a regular basis. Whites, Blacks, and Blacks The first thing that you will use is the White and Black tool. Basically, you will click on this tool and drag it around the image until you get the contrast that you want. In the Elements version, this tool has one big advantage over the normal Photoshop version. Since you can edit any photo in the Elements version of Photoshop, you can get the best contrast out of the image and save a lot of time. Highlights and Shadows The next tool that you will use is the Highlights and Shadows tool. It is similar to the White and Black tool, but it works in two ways. The first way is to click on the tool and drag it around the image until you get the effect that you want. The second way is to click on the tool's adjustment layer and adjust the amount that you want. In the Elements version of Photoshop, Highlights and Shadows tool has some great features. For instance, you can change the balance of the dark or light effect of the image.

Also, you can hide the tool to not show the tool every time that you click on a tool. Curves and Levels As another way to edit images with this tool, you can click on the tool and adjust the curves for the image in many ways. The relation between insulin resistance and high intrahepatic triglyceride content in nonalcoholic steatohepatitis. Nonalcoholic steatohepatitis (NASH) is associated with insulin resistance and excessive hepatic lipid accumulation. However, it is unknown whether NASH liver exhibits abnormal de novo lipogenesis or defective fatty acid oxidation. We hypothesized that the development of NASH would be preceded by low hepatic function of fatty acid oxidation and reduced hepatic de novo lipogenesis. To test this hypothesis, we investigated (1) metabolic profiles in NASH livers and (2) the hypothesis that accumulation of intrahepatic lipid is associated with insulin resistance and liver dysfunction in NASH. We enrolled 30 NASH patients and compared their clinical profiles with the findings in 30 healthy subjects. In 13 NASH patients, an oral glucose tolerance test (OGTT) was performed. We estimated metabolic parameters by magnetic resonance spectroscopy and investigated the rate of de novo lipogenesis by $[(1)H]$-13C-acetate. The results were compared with the hepatic triglyceride content from liver biopsy. NASH patients had elevated fasting plasma glucose and triglyceride levels, insulin resistance, and reduced homeostasis model assessment-insulin resistance. Moreover, OGTT revealed increased plasma glucose and insulin levels during the test. In 13 NASH patients, the rate of de novo lipogenesis and the hepatic triglyceride content were markedly reduced compared with those of the control subjects. The degree of liver steatosis was positively correlated with insulin resistance, de novo lipogenesis, and fasting plasma triglyceride levels. Hepatic triglyceride content in NASH correlated with the fraction of the intrahepatic lipids which was composed of triglyceride molecules and the fasting insulin concentration. The hepatic triglyceride content in NASH is associated with liver steatosis, insulin resistance, and fasting plasma triglyceride levels, indicating that the development of NASH is preceded by reduced de novo lipogenesis and increased triglyceride accumulation.Q: How to compare two strings stored in ArrayList elements I have a List of String from which I have to make a new List of string called header and header contains all the String from the List.
